

# Space Charge Effect at MicroBooNE

**Michael Mooney**

*The experiment formerly known as LBNE – BNL Meeting  
February 11<sup>th</sup>, 2015*

# Introduction

- ◆ BNL has developed a tool to study space charge effect at the MicroBooNE detector
  - **SpaCE** – Space Charge Estimator
  - Study **simple problems** first in detail with dedicated simulations
  - Maintain complete control over simulation chain for now – no LArSoft, no ANSYS, **only code we develop** (thus fully understand)
  - Eventually can network with LArSoft to extract correction factors from calibration and to simulate effect in MC
- ◆ Outline:
  - Brief review of Space Charge Effect (SCE)
  - Overview of SpaCE
  - **Simulation** of effect on physics object reconstruction
  - Proposal of **calibration** scheme using laser tracks + cosmic muons

# Roadmap of Today's Talk

## 1. Review of Space Charge Effect

## 2. Overview of SpaCE Code Suite

## 3. Simulation of SCE

## 4. Calibration Scheme

# Space Charge Effect

- ♦ **Space charge:** excess electric **charge** (slow-moving ions) distributed over region of **space** due to cosmic muons passing through the liquid argon
  - Modifies E field in TPC, thus track/shower reconstruction
  - For LAr neutrino experiments, effect **worst** at MicroBooNE

$$\alpha = \frac{D}{E_0} \sqrt{\frac{K}{\epsilon\mu}}$$

$$\mathbf{v} = \mu\mathbf{E}$$

**No Drift!**

# Impact on E Field

- ◆ Visualization of impact on E field (Bo Yu's Maxwell-2D studies)
- ◆ Assumptions:
  - Constant charge deposition rate throughout detector
  - No liquid argon flow – **serious complication**

Drift Direction

Lateral Directions

B. Yu

# Impact on Track Reco.

◆ Two separate effects on reconstructed **tracks**:

- Ⓐ • Reconstructed track shortens laterally (looks rotated)
- Ⓑ • Reconstructed track bows toward cathode (greater effect near center of detector)

◆ Can obtain straight track (or multiple-scattering track) by applying corrections derived from data-driven calibration

# SpaCE: Overview

- ◆ Code written in C++ with ROOT libraries
- ◆ Also makes use of external libraries (ALGLIB)
- ◆ Primary features:
  - Obtain E fields analytically (on 3D grid) via **Fourier series**
  - Use **interpolation** scheme (RBF – radial basis functions) to obtain E fields in between solution points on grid
  - Generate tracks in volume – line of uniformly-spaced points
  - Employ **ray-tracing** to “read out” reconstructed {x,y,z} point for each track point – RKF45 method
- ◆ First implemented effects of uniform space charge deposition without liquid argon flow (only linear space charge density)
  - Recently: solved for **arbitrary space charge configuration**
    - Can now model effects of liquid argon flow!

# Compare to FE Results: $E_x$

- ◆ Looking at central z slice ( $z = 5$  m) in x-y plane
- ◆ Very good shape agreement compared to Bo's 2D FE (Finite Element) studies
- ◆ Normalization differences understood (using different rate)

# Compare to FE Results: $E_y$

- ◆ Looking at central z slice ( $z = 5$  m) in x-y plane
- ◆ Very good shape agreement here as well
  - Parity flip due to difference in definition of coordinate system

# E Field Interpolation

- ◆ Compare 30 x 30 x 120 field calculation (left) to 15 x 15 x 60 field calculation with interpolation (right)
- ◆ Include analytical continuation of solution points **beyond** boundaries in model – improves performance near edges

Actual  $\Delta E_x/E_{\text{nominal}}$  [%]: Z = 5.00 m

Interpolated  $\Delta E_x/E_{\text{nominal}}$  [%]: Z = 5.00 m

# Ray-Tracing

- ◆ Example: track placed at  $x = 1 \text{ m}$  (anode at  $x = 2.5 \text{ m}$ )
  - $z = 5 \text{ m}, y = [0, 2.5] \text{ m}$

Track Ionization Electrons: X Reconstruction

Track Ionization Electrons: Y Reconstruction

# Sample “Cosmic Event”

**Nominal Drift  
Field**

**500 V/cm**

**Half Drift  
Field**

**250 V/cm**

# Simulation of SC Effect

- ◆ Can use SpaCE to produce displacement maps
  - **Forward transportation:**  $\{x, y, z\}_{\text{true}} \rightarrow \{x, y, z\}_{\text{reco}}$ 
    - Use to **simulate** effect in MC
    - Uncertainties describe accuracy of simulation
  - **Backward transportation:**  $\{x, y, z\}_{\text{reco}} \rightarrow \{x, y, z\}_{\text{true}}$ 
    - Derive from **calibration** and use in data or MC to correct reconstruction bias
    - Uncertainties describe remainder systematic after bias-correction
- ◆ Two principal methods to encode displacement maps:
  - **Matrix representation** – more generic/flexible
  - **Parametric** representation (for now, 5<sup>th</sup>/7<sup>th</sup> order polynomials) – fewer parameters
    - Uses matrix representation as input

# Simulation: Matrix Rep.

- ◆ Below: example of **forward transportation** for central z slice
- ◆ Can use interpolation methods to go to finer scales
- ◆ Can similarly produce backward transportation maps with same information and using interpolation methods

$X_{\text{reco}} - X_{\text{true}} [\text{cm}]: Z = 5.00 \text{ m}$

$Y_{\text{reco}} - Y_{\text{true}} [\text{cm}]: Z = 5.00 \text{ m}$

# Physics Impact of SCE

- ◆ A significant fraction of the CCQE muons will not be fully-contained within the detector... **how to measure  $p_{\text{track}}$** ?

Contained = 37%, Long (>1m) Non-Contained = 27%

# Using MCS to Measure $p_{\text{track}}$

**Idea:** RMS of  $\Delta\theta$  distribution  $\rightarrow p_{\text{track}}$  (“ $p_{\text{RECO}}$ ”)

*Small angle deflections are governed by the so-called modified Highland formula*

$$\theta_0 = \frac{13.6}{p\beta c} \sqrt{\frac{\ell}{X_0}} \left[ 1 + 0.0038 \ln\left(\frac{\ell}{X_0}\right) \right]$$

$\theta_0$  : RMS of the  $\Delta\theta$  distribution (mrad)

$p$  : particle momentum (GeV/c)

$\ell$  : material thickness

$X_0$  : radiation length

**L. Kalousis**

- ◆ Use angular deflections of track due to Multiple Coulomb Scattering (MCS) in order to find  $p_{\text{track}}$
- ◆ Need to see how SCE impacts this measurement!

**Momentum determination via MCS**

# Laser Track Calibrations

- ◆ Can use laser system to calibrate out space charge effect
  - True laser track + reconstructed track → measure **backward transportation** displacement map
  - Evaluating performance of proposed laser track correction algorithms
- ◆ Complications:
  - Can't address time-dependencies of LAr flow, if non-negligible
  - Laser system **can only target part of TPC**

# Calibration Scheme: SCT

- ◆ Proposal: fill in backward transportation displacement maps (where laser system can't reach) using **tomography** technique involving cosmic muons
- ◆ Algorithm: **Space Charge Tomography (SCT)**
- ◆ Main concepts:
  - First use laser crossings to unambiguously calibrate points in TPC bulk – “X”
  - Then use single laser tracks to calibrate points in bulk and on detector faces (the latter unambiguously) – “L”
  - Next use ensembles of cosmic muons passing through either anode and one other TPC face (near laser-calibrated point) or two non-anode TPC faces (near laser-calibrated points) – “ $\mu$ ”
    - No displacement at anode plane; know cosmic muon  $t_0$  from PMT system
    - Use median  $\{\Delta x, \Delta y, \Delta z\}$  correction: **multiple-scattering averages out**
  - **Iterate**:  $X \rightarrow L \rightarrow \bar{\mu} \rightarrow L \rightarrow \bar{\mu} \rightarrow L \rightarrow \dots$  (with  $\bar{\mu} = \mu \rightarrow \mu \rightarrow \mu \rightarrow \dots$ )
    - Use crossings of different muon paths ( $\mu$ ) within  $\bar{\mu}$  iteration (like X)

# SCT “ $\mu$ ” Step: no MCS

**Correction to Point P:**  
 $\{\Delta x, \Delta y, \Delta z\}$

Assumes perfect  
laser-track alg.  
(Bern)

# SCT “ $\mu$ ” Step: with MCS

**Correction to Point P:**  
 $\{\Delta x_{\text{median}}, \Delta y_{\text{median}}, \Delta z_{\text{median}}\}$

# Another SCT “ $\mu$ ” Step (“X”-like)

Update Correction to Point P

# Summary/Plans

- ◆ **SpaCE** – use to study space charge effect at MicroBooNE
  - Understand simple problems first
  - Stand-alone C++ code with ROOT libraries
  - Can import into LArSoft for purposes of **simulation** and **calibration**
    - This effort has already begun!
    - Will be available for other experiments (e.g. 35-ton)
- ◆ Working with Erik Voirin to understand possible effects of **LAr flow** on space charge configuration – impacts calibration ideas
- ◆ Study **SCT (Space Charge Tomography)** calibration scheme
  - First using toy MC, then LArSoft simulation, then actual data

# 35-ton Sneak Peek!

$Y_{\text{reco}} - Y_{\text{true}} [\text{cm}]: Z = 0.80 \text{ m}$

$E_y$   
Without  
LAr Flow

$Y_{\text{reco}} - Y_{\text{true}} [\text{cm}]: Z = 0.80 \text{ m}$

$E_y$   
With  
LAr Flow

Q map from  
E. Voirin

$Z_{\text{reco}} - Z_{\text{true}} [\text{cm}]: Z = 0.80 \text{ m}$

$E_z$   
Without  
LAr Flow

$Z_{\text{reco}} - Z_{\text{true}} [\text{cm}]: Z = 0.80 \text{ m}$

# BACKUP SLIDES

# Relevant Numbers

- ◆ Nominal electron drift velocity: **1.6 mm/ $\mu$ s**
- ◆ Ion drift velocity: **8 mm/s**
- ◆ Cosmic muon flux:
  - Vertical: **200/m<sup>2</sup>/s**
  - Horizontal: **60/m<sup>2</sup>/s**
- ◆ Max ion charge density in LAr: **90 nC/m<sup>3</sup>**
- ◆ Expected modification to magnitude of E field (compared to nominal drift E field of 500 V/cm):
  - Typical:  **$\pm 3\%$**
  - Maximal:  **$\pm 6\%$**
- ◆ Worst-case effects on reconstructed electron position:
  - Drift direction: **1.5 cm**
  - Lateral directions: **8 cm**

# Complications

- ◆ Not accounting for non-uniform charge deposition rate in detector → significant modification?
- ◆ Flow of liquid argon → likely significant effect!
  - Previous flow studies in 2D... differences in 3D?
  - Time dependencies?

**No Flow**

**Flow w/o Turbulence**

**Flow w/ Turbulence**

# Liquid Argon Flow

# SpaCE Performance

## ◆ Faster ray-tracing time

- Was **~5 minutes** per cosmic event (10 random tracks)
- Now **~10 seconds** per cosmic event
- Can get ~10,000 events in one day of running on **one** machine
  - Use ensemble of events to test calibrations that make use of cosmic muons
  - Can use parametric methods to speed studies up significantly

## ◆ Improved E field interpolation between grid points

- Used 5 layers of grid points outside boundaries
- Points not physical (not inside volume) but help smoothing of solution near edges
- Boundaries vastly improved, regions near cathode still a minor issue (~10% discrepancy w.r.t. correction to nominal drift field)

# E Field Calc. Convergence

## Example: $E_x$ Convergence in x-y Plane ( $z = 5$ m)

$E_x$  Convergence: (X,Y,Z) = (0.25 m, 2.00 m, 5.00 m)

**y = 2 m**

$E_x$  Convergence: (X,Y,Z) = (1.25 m, 2.00 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (2.00 m, 2.00 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (0.25 m, 1.25 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (1.25 m, 1.25 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (2.00 m, 1.25 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (0.25 m, 0.25 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (1.25 m, 0.25 m, 5.00 m)

$E_x$  Convergence: (X,Y,Z) = (2.00 m, 0.25 m, 5.00 m)

**x = 0.25 m**

**x = 1.25 m**

**x = 2 m**

# E Field Calc. Uncertainty

Estimation of  $\Delta E_x$  (Z = 5.00 m)

Absolute Uncertainty on  $\Delta E_x$  Estimation (Z = 5.00 m)

Relative Uncertainty on  $\Delta E_x$  Estimation (Z = 5.00 m)

Estimation of  $\Delta E_x$  (Z = 5.00 m)

Absolute Uncertainty on  $\Delta E_x$  Estimation (Z = 5.00 m)

Relative Uncertainty on  $\Delta E_x$  Estimation (Z = 5.00 m)

# E Field Interp. Uncert.

**$E_x$**   
**Difference**

**$E_x$**   
**Ratio**

$\Delta E_x / E_{\text{nominal}}$  Interp-Actual [%]: Z = 5.00 m

$\Delta E_x / E_{\text{nominal}}$  (Interp-Actual)/Actual: Z = 5.00 m

# Simulation: Parametric Rep.

**Residuals of  
Forward Transportation  
(Uncert. in Simulation of  
Effect)**

**Impact of  
Space Charge Effect  
(Reconstruction Bias)**

**Residuals of  
Backward Transportation  
(Post-bias-correction Uncert.  
for Perfect Calibration)**

**Reality: these will  
be larger!**

# Smoking-gun Test for SCE

- ◆ Can use cosmic muon tracks for calibration
  - Possibly sample smaller time scales more relevant for a particular neutrino-crossing time slice
  - Minimally: data-driven cross-check against laser system calibration
- ◆ **Smoking-gun test:** see lateral charge displacement at track ends of non-contained cosmic muons → space charge effect!
  - No timing offset at transverse detector faces (no  $E_x$  distortions)
  - Most obvious feature of space charge effect

# Cosmics: Dist. from Edge

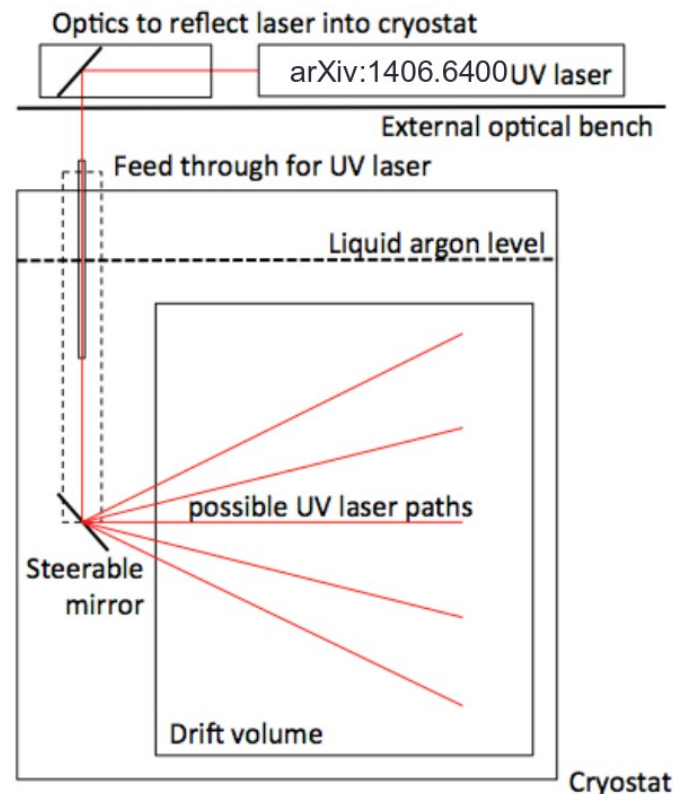

- ◆ Very clear qualitative signs of effect in this distribution
- ◆ Sensitivity to rate of cosmic muon flux
  - Sharp cut-off at maximal distortion

# Laser System

- ◆ Can use laser system for calibrations, but:
  - Only once per day
  - Limited set of laser paths
  - Ambiguity of correction direction for reconstructed ionization electron clusters
- ◆ Intersection of two laser beams would remove ambiguity
  - Use to seed correction algorithms
- ◆ Working with Christoph to help evaluate calibration methods
